How Ativan Works

Ativan enhances the activity of **GABA (Gamma-Aminobutyric Acid)** in the brain. GABA is a neurotransmitter that reduces excessive brain activity, promoting calmness and relaxation. By binding to GABA receptors, Ativan slows down nerve activity, helping to manage anxiety and improve sleep quality.

When to Use Ativan

Ativan is primarily prescribed for:

- Generalized Anxiety Disorder (GAD)
- Panic attacks and acute anxiety episodes
- Short-term management of insomnia
- Seizure disorders, including status epilepticus
- Preoperative sedation and anxiety reduction before medical procedures

It is important to follow the prescribed dosage and not to exceed the recommended duration without consulting a healthcare professional.

Recommended Dosage

The dosage of Ativan varies depending on the condition being treated, age, and overall health.

- **Anxiety:** 1–3 mg per day, divided into 2–3 doses
- **Insomnia:** 2–4 mg at bedtime
- **Seizures:** 4 mg initially, followed by additional doses as needed

 **Important:** Do not abruptly stop taking Ativan, as it can lead to withdrawal symptoms. Always consult your doctor before adjusting the dosage.
